Self-Awareness in Autonomic Systems

Managing systems is increasingly becoming more challenging. Different devices, heterogeneous platforms and different programming models can now be connected into a single system, and devices are increasing in technological complexity. These factors not only make systems unmanageable but lead to systems exhibiting unplanned behaviours. To counter this, systems must become self-aware, exhibiting context-awareness at an internal and external level.

Awareness is a Future and Emerging Technologies Proactive Initiative funded by the European Commission under FP7
